

## The maturation and the evaluation of the great projects of investment

The great projects of investment in the field of the infrastructures, the equipment and installation require today a maturation and a progressive evaluation since the installation of the policy by the decision makers until the assessment and the capitalization after startup.

The principal phases of maturation must be the occasion to legitimate the options, to confirm the appropriateness of the projects and the taking into account of the durable development and to guarantee to them feasibility thereafter. They are used also as basis for the evaluation of the environmental and social impacts like to the phases of dialogue with the citizens and the partners. The retrospective appraisal of the projects allows, quantifying it, to check the relevance of the projects and the adequacy of the functions and the exploitation to the initial objectives of the investment. It is also used with the capitalization and as improvement of the processes.

This formation will make it possible to apprehend the roles and missions of the actors, the contents and the objectives of each stage of maturation and evaluation and the qualitative approach of unrolled projects.
