

This seminar, thanks to French experience, acquired particularly in large cities like Toulouse, will enable the participants to :

- Learn the integrated approach methods to urban drainage, the diagnosis of existing systems and the preparation of investment and management methods of drainage services
- Draw up technical and financial specifications for projects
- Learn the different techniques for communication and control for work and services that are sub-contracted

This course will also improve the participants knowledge of the constraints of the private sector as the public one, and their understanding of how each one operates, which is vital for success of common projects

Targeted audience

Managers for the water, sewage and drainage, political, technical and administrative decision-makers

Monday, 22nd of June

■ 9h30 **J-Olivier LAVAL** PFC-Metrattech

Opening of the seminar
